CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Two water samples were received for analysis at Columbia Analytical Services on 02/28/07. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

Total Sulfide by EPA Method 376.2:
The matrix spike recovery of Total Sulfide for sample 231GW09CL was outside control criteria. A duplicate matrix spike was analyzed with a similar recovery. Recovery in the Laboratory Control Sample (LCS) was acceptable, which indicates the analytical batch was in control. The matrix spike outlier suggests a potential low bias in this matrix. No further corrective action was appropriate.

No other anomalies associated with the analysis of these samples were observed.

Total Metals

Matrix Spike Recovery Exceptions:
The matrix spike recovery of Selenium for sample LF6GW105CL was outside control limits. No target analytes were detected in the unspiked sample. The error associated with elevated recoveries equates to a high bias, thus the elevated recovery likely has no significance to the sample results. Recovery in the Laboratory Control Sample (LCS) was acceptable, which indicates the analytical batch was in control. No further corrective action was taken

No other anomalies associated with the analysis of these samples were observed.

CAS Standard Identification Codes and Abbreviated Footnotes for Chromatograms

G1 Sample was analyzed past the end of recommended holding time. See Nonconformity sheet.
G2 Sample was reanalyzed past holding time. Initial analysis was performed within recommended holding time.
G4 Sample was received past the end of recommended holding time.
R1 High RPD is because the duplicate sample results are less than three times the method reporting limit.
i MRL is elevated because of matrix interferences and the sample required diluting.
F Sample filtered primary to analysis.

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

Sample Receipt

Three water samples were received for analysis at Columbia Analytical Services on 03/02/07. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

General Chemistry Parameters

Total Sulfide by EPA Method 376.2:
The matrix spike recovery of Total Sulfide for sample 1047MW101CL was outside control criteria due to suspected matrix interferences. A duplicate matrix spike was analyzed with a similar recovery. Recovery in the Laboratory Control Sample (LCS) was acceptable, which indicates the analytical batch was in control. The matrix spike outlier suggests a potential low bias in this matrix. No further corrective action was appropriate.

No anomalies associated with the analysis of these samples were observed.

Total Metals

No anomalies associated with the analysis of these samples were observed.

Diesel Range Organics by EPA Method 8015B

No anomalies associated with the analysis of these samples were observed.

Gasoline Range Organics by EPA Method 8015B

No anomalies associated with the analysis of these samples were observed.

Organochlorine Pesticides by EPA Method 8081A

Second Source Exceptions:
The analysis of Chlorinated Pesticides by EPA 8081 requires the use of dual column confirmation. When the Initial Calibration Verification (ICV) criteria are met for both columns, the higher of the two sample results is generally reported. The primary evaluation criteria were not met on the confirmation column for Toxaphene in CAL 6126. The ICV results are reported from the acceptable column. The data quality is not affected. No further corrective action was necessary.

Continuing Calibration Verification (CCV) Exceptions:
The primary evaluation criterion was exceeded for alpha-BHC, gamma-BHC, Hepachlor, Aldrin, 4,4'-DDE, and Endrin in CCV 0327F027. In accordance with CAS standard operating procedures, the alternative evaluation

Approved by Gregory Salvatore **Date** 4/2/07

specified in the EPA method was performed using the average percent recovery of all analytes in the verification standard. The standard meets the alternative evaluation criteria.

Matrix Spike Recovery Exceptions:
Insufficient sample volume was received to perform a Matrix Spike/Matrix Spike Duplicate (MS/MSD). A Laboratory Control Sample/Duplicate Laboratory Control Sample (LCS/DLCS) was analyzed and reported in lieu of the MS/MSD for these samples.

No other anomalies associated with the analysis of these samples were observed.

Volatile Organic Compounds by EPA Method 8260B

Initial Calibration (ICAL) Exceptions:
The primary evaluation criterion was exceeded for Acetone, cis-1,3-Dichloropropene, trans-1,3-Dichloropropene, and Bromoform in ICAL ID CAL6077. In accordance with CAS standard operating procedures, the alternative evaluation specified in the EPA method was performed using the mean Relative Standard Deviation (RSD) of all analytes in the calibration. The result of the mean RSD calculation was 8.6%. The calibration meets the alternative evaluation criteria. Note that CAS/Kelso policy does not allow the use of averaging if any analyte in the ICAL exceeds 30% RSD.

The CAS minimum relative response factor criterion for 2-Butanone (MEK) was not met in ICAL ID CAL6077. In accordance with CAS standard operating procedures, a Method Reporting Limit (MRL) check standard containing the analyte of concern was analyzed each day of analysis. The MRL check standard verifies instrument sensitivity was adequate to detect the analyte at the MRL on the day of analysis. Because the sensitivity was shown to be adequate to detect the compound in question, the data quality is not significantly affected. No further corrective action was appropriate.

No other anomalies associated with the analysis of these samples were observed.

Polynuclear Aromatic Hydrocarbons by EPA Method 8310

Continuing Calibration Verification (CCV) Exceptions:
The primary evaluation criterion was exceeded for the analyte Benzo(g,h,i)perylene in the FLD signals for CCVs KWG0704189-1, KWG0704189-2 and KWG0704189-3. In accordance with CAS standard operating procedures, the alternative evaluation specified in the EPA method was performed using the average percent recovery of all analytes in the verification standard. The standard meets the alternative evaluation criteria with respect to these analytes.

Matrix Spike Recovery Exceptions:
The matrix spike recovery of Dibenz(a,h)anthracene for sample 1349MW01CL was outside control criteria. Recovery in the Laboratory Control Sample (LCS) was acceptable, which indicates the analytical batch was in control. The matrix spike outlier suggests a potential high bias in this matrix. The sample did not contain the analyte in question. No further corrective action was appropriate.

Sample Confirmation Notes:
The confirmation comparison criteria of 40% difference for Dibenz(a,h)anthracene was exceeded in sample 1349MW01CLMS. The higher of the two values is reported because no evidence of matrix interference was observed.

No other anomalies associated with the analysis of these samples were observed.

CAS Standard Identification Codes and Abbreviated Footnotes for Chromatograms

G1 Sample was analyzed past the end of recommended holding time. See Nonconformity sheet.
G2 Sample was reanalyzed past holding time. Initial analysis was performed within recommended holding time.
G4 Sample was received past the end of recommended holding time.
R1 High RPD is because the duplicate sample results are less than three times the method reporting limit.
I MRL is elevated because of matrix interferences and the sample required diluting.
F Sample filtered primary to analysis.

Appendix from EXT-3535
For Extracting 8081/8082 Compounds in water by
EPA Method 3535A

1. Mark the level of the sample on the sample container for determination of sample volume.
2. Adjust pH of the sample to 2 using H2SO4. Be careful not to go below 2, as this will cause breakdown of the extraction disk.
3. Add between 2mL and 5mL of methanol to each sample, and shake well.
4. Add 100uL of 8081/8082 surrogate to all samples and 50uL of 8081 spike to Pest QC and 50uL of 8082 spike to PCB QC.
5. Shake sample to mix.
6. Prepare sample bottles with Horizon cap adapters and verify seal
7. Run purge method 8081.4 on extractors 2 times.
8. Assemble extractors using UCT brand C18 cartridges.
9. Load extraction program 8081.6 on the Horizon control box.
10. Load samples onto Horizon extractors and slowly turn clockwise until sample seal is broken. (Glug effect)
11. Start extraction program.
12. Run purge method 8081.8 on extractors between samples.
13. Take VOA vial extract to Dry Disk station. Place dry disk in vacuum system and rinse once with DCM, then condition with one Hexane rinse. Place turbovap tube into place for collection. Pour sample onto the Dry Disk and rinse VOA vial 2 times with Hexane. After sample has been vacuumed from water, agitate water with one more Hexane rinse.
14. Place sample into tubovap and concentrate with a nitrogen flow just strong enough to create a vortex.
15. Concentrate Hexane and take to a 2mL final volume in Hexane. Split, if necessary, pesticide from PCB portion using a 1mL pipette and placing pesticide aliquot in a yellow autosampler vial. After remaining PCB aliquot has had an Acid clean-up, hexane portion is removed and then placed in a green autosampler vial.
